When reinforced with steel, however, concrete can be used for slabs, walls, beams, columns, foundations, frames, and more. Concrete is only strong against forces of compression and has low tensile strength and ductility. Reinforcement materials are needed to withstand shear and tensile forces on the concrete.

in cantilever beam one side is overhanging, so reinforcement is provided at top .concrete is weak in tension and strong in compression in case of salb. but in cantilever concrete is weak in compression and strong in tension. compression zone is at up ward and tension zone is at downward. so we provide reinforcement at top.

Reinforcement mesh, or steel fabric, is a premade lattice of rebar used to improve the lateral strength of concrete slabs, walls, and other constructions. Standardised mesh fabric is defined in British Standard denominations (such as A193, or B785). These numbers refer to the cross sectional areas of the mesh per metre squared.

Use wire mesh for driveways that are 4 to 5 inches thick, and rebar for those that are 5 inches or more. Place rebar in a grid pattern with a spacing between bars of approximately 12 inches. In either case, blocks should be used under the reinforcement to keep centered within the concrete.

Concrete Design Guide. No. 4: An introduction to strut-and-tie modelling Strut-and-tie modelling is a simple method of modelling complex stress patterns in reinforced concrete as triangulated models. It is based on the same truss analogy as the design for shear in Eurocode 2 and can be applied to many elements.

The following are the reasons why we should maintain a minimum concrete cover-It protects reinforcement bars from bad effects of weather. Concrete cover acts as thermal insulation of reinforcement bars to protect it from fire. It provides enough embedding to reinforcement bars to enable them to be stressed without slipping.

A reinforced concrete floor is one that is made from a slab, which is a flat plate made of concrete, that has both surfaces parallel to each other and inside has steel beams that support the structure. One aspect to highlight is that if steel bars are incorporated into the concrete, what is known as reinforced concrete is formed.
