There are two methods of measurement: 1) direct comparison with the standard, and 2) indirect comparison with the standard. Both the methods are discussed below: Direct Comparison with the Standard. In the direct comparison method of measurement, we compare the quantity directly with the primary or secondary standard.

The different methods of measurement are explained below in details. Direct Method of Measurement - In this method of measurement, the unknown quantity is directly compared with the standard quantity. The result of the quantity is expressed in number. It is the most common method of measuring the physical quantities like length, temperature, pressure, etc.

~~Measurement — Designing Buildings Wiki~~

There are two methods for performing dimensional measurements: direct measurement and indirect measurement. With direct measurements, measuring instruments such as Vernier calipers, micrometers, and coordinate measuring machines are used to measure the dimensions of the target directly. These measurements are also known as absolute measurements. Measurements can be performed over a wide range specified by the scale of the measuring instrument, but there is also the chance that the ...

Although the concept of weights and measures today includes such factors as temperature, luminosity, pressure, and electric current, it once consisted of only four basic measurements: mass (weight), distance or length, area, and volume (liquid or grain measure). The last three are, of course, closely related.
